

■ PROJECT JARVIS

Manual GitHub Actions Build — Step-by-Step Checklist

1. Prerequisites — install these once

- Git — github.com/git-guides/install-git
- GitHub CLI (optional, for one-command deploy) — cli.github.com
- Flutter SDK — docs.flutter.dev/get-started/install (Android toolchain configured).

Verify with: **flutter doctor** — it should show “Flutter”, “Android toolchain” and “Android Studio” all ✓.

2. Create a GitHub repository

- Go to github.com → New repository.
- Name it **project_jarvis** (or anything), keep it **Private** if you want, do NOT tick “Add a README”.
- Click **Create repository** — you’ll see the push commands (we’ll use our own below).

3. Generate missing platform scaffolding (once)

- The repo ships source code but the binary Gradle wrapper jar can’t be versioned as text. Run this in the project folder:

```
flutter create --platforms=android --org com.example .
```

4. Push the code to GitHub

- In your project folder (where pubspec.yaml lives):

```
git init
git add .
git commit -m "Project JARVIS - initial commit"
git branch -M main
git remote add origin https://github.com/YOUR_USERNAME/project_jarvis.git
git push -u origin main
```

5. (Recommended) Add your Gemini API key as a Secret

- On GitHub: repo → **Settings** → **Secrets and variables** → **Actions** → **New repository secret**.
- **Name:** GEMINI_KEY
- **Value:** your Google AI Studio API key
- Save. The workflow injects it via `--dart-define` — it is never committed.
- Add signing secrets too if you want a properly signed release APK:
- KEYSTORE_BASE64, KEYSTORE_PASSWORD, KEY_PASSWORD, KEY_ALIAS.

6. Trigger the build

- Option A — automatic: pushing to **main** already starts the workflow.
- Option B — manual: repo → **Actions** tab → “Build Release APK” → **Run workflow**.
- Watch the run turn green (5–10 minutes).

7. Download your APK

- Open the finished run (green ✓).
- Scroll to the **Artifacts** section.

- Click **project-jarvis-release** → downloads **app-release.apk**.
- That direct link looks like:
- https://github.com/YOUR_USERNAME/project_jarvis/actions/runs/<run-id>/artifacts/<artifact-id>
- Install on Android: copy the APK to your phone and open it (allow “install unknown apps”).

8. One-command alternative (deploy.sh)

- If GitHub CLI is installed, just run **./deploy.sh** — it pushes, sets secrets, starts the workflow, waits, and prints your download link automatically.
- Setup: brew install gh → gh auth login → ./deploy.sh

Troubleshooting

Problem	Fix
“Missing gradle-wrapper.jar”	Run flutter create --platforms=android . once, then commit.
“Gemini API key not configured”	Set the GEMINI_KEY secret, or set it in lib/config/app_config.dart.
gemini-2.5-flash not found	Your tier may not expose it — change the model in app_config.dart to gemini-1.5-flash.
Build passes but no artifact	Check the run → steps → “Upload release APK artifact” logs.
